

the first outlet has an opening in a longitudinal direction of the housing,

the second outlet has an opening in a downward direction at an angle from 40 degrees to 50 degrees with respect to the longitudinal direction of the housing, and

the first outlet and second outlet are selectively opened and closed according to rotation of the distributor motor shaft.

**19.** The dish washing machine of claim 1, wherein at least one of a first outlet and a second outlet, among the plurality of outlets, has an opening in an upward direction of the housing that is selectively opened and closed according to rotation of the at least one opening and closing member.

**20.** A dish washing machine, comprising:

a pump including a pumping motor configured to pump washing water, a pumping motor shaft, and a housing including a plurality of outlets; and

a distributor configured to distribute the washing water pumped by the pumping motor to at least one of a plurality of jet nozzles through at least one of the plurality of outlets, the distributor including:

a distributor motor shaft having an axial direction different from an axial direction of the pumping motor shaft;

at least one opening and closing member configured to be rotatable in the housing of the pump to selectively open and close at least one of the plurality of outlets; and

a distributor motor which rotates the at least one opening and closing member about the distributor motor shaft.
